Advanced Technologies for Novel Therapeutics (ATNT) is the first biotech company which develops novel cross-disciplinary engineering methods, to find the most effective molecular targets for treatment of complex human disorders. Every year billions of dollars are spent in pharmaceutical and biotech companies, to discover novel therapeutic targets. ATNT is the leading provider of a universal target discovery service, which significantly minimizes the research and development cost of finding the most effective therapeutic targets. ATNT founders are well-recognized university professors whose areas of expertise encompass molecular biology, cell biology, biochemistry, molecular genetics, human genetics, animal models, systems biology and engineering disciplines. Our staff members are high profile experts in engineering and biology. In ATNT we have successfully developed novel tools and techniques, to identify the most important therapeutic targets in complex cellular networks. Using patented technologies, ATNT provides a unique service to pharmaceutical and biotech companies. Our service will provide a set of therapeutic targets that have the minimal chance of failure, therefore minimizes the time and cost of finding novel therapeutics. ATNT also provides a not-for-profit service for academic institution to find the most important regulators of their molecules of interest.

Located at the heart of three leading biomedical and engineering academic institutions in University Heights, ATNT bring together a unique team of scientists and engineers. ATNT uses advanced technologies and state of the art facilities to target the most promising molecules for treatment of complex human diseases.

BanDeMar Networks, LLC, is a minority owned small company specializing in advanced video solutions for e-learning markets. Our products and services include just-in-time multimedia training over cell phones, real-time global imagery, multi-player collaborative live webcasting, and real-time health and biometric monitoring. By complying with international open standards, our products and services interoperate smoothly with our clients' information technology assets and instructional designs. Our clients include private and government agencies in the US and Europe. For the most challenging of applications, BanDeMar Networks has the resources to fund, develop, and deploy new technologies and content. Our academia, medical, and science outreach partners include subject matter experts that ensure the accuracy of content, and our experienced company members (Ph.D. in systems engineering, J.D. in intellectual property law, and practicing M.D.) ensure overall project success. BanDeMar Networks is uniquely experienced in consolidating intellectual property, early enterprise adopters, and federal entrepreneurial funding. The IP holders, early adopters, and funding sources all effectively become clients of BanDeMar Networks, and the synergy required between all parties requires their careful selection and management by BanDeMar. This business model interfaces with those of research organizations (including academia), enterprise users (private and governmental), and investors (private equity and government incentives for small business).

CyberExtruder is a software development company whose patented core technology enables the automatic conversion of a single two dimensional ("2D") facial image (e.g. passport photo) to an accurate three dimensional ("3D") model of the subject's face or head. This technology has significant applications in two industry segments: (1) as an enabling technology in the biometric technology segment of the security industry, and (2) as a personalization technology in the very hot sector of New Media. One example is putting your face on avatars in Second Life, a 3-D virtual world entirely built and owned by its residents. Since opening to the public in 2003, Second Life has grown explosively and today is inhabited by a total of 4,177,015 people from around the globe. Second Lifers can do anything and go anywhere, movies, museums and concerts; it's like "The Matrix" meets MySpace. It fosters real relationships with online alter egos called avatars, a computer-generated graphic. The words, thoughts and feelings that are expressed by that avatar are a real person's and now users can easily put their stylized face on the character in seconds using CyberExtruder's software.

Optimal Analysis (Sobrex) is a new composition of matter, which in small doses completely blocks alcohol inebriation. At higher dosages, the time required for clinical withdrawal is radically reduced and traumata are rapidly eliminated. Drug toxicity has been demonstrated to be very low at dosages ten times greater than those needed for detoxification. Also, because the drug blocks inebriation it automatically prevents re-addiction (recidivism), and appears safe to take for extended periods of time. The drug also completely eliminates nicotine withdrawal traumata at very low dosages in about 36 hours.

RCB Labs, Inc. is a small contract research organization (CRO) with the primary objective of providing client-specific services in the area of biological research. The company specializes in the preparation of custom biologicals for the biotech industry. More specifically, RCB Labs works alongside biotech companies in offering consulting services and expert advice in conducting research on the development of new methods/ techniques for the identification, concentration and purification of novel naturally occurring biomolecules (such as membrane or receptor proteins, lipid molecules etc). These purified biomolecules thereafter become key components of immunology-based assays used for the detection and/or understanding the underlying mechanisms of human health and disease.

Rennergy, LLC is a start-up energy company that will manufacture leading edge solar products that will significantly aid the reduction of the cost of electricity generated by solar technology. There is a rapidly emerging trend in photovoltaics that reduces the cost of ownership of photovoltaics- a particular line of photovoltaics called Building Integrated Photovoltaics (BIVP). Reenergy will utilize this inevitable shift in the implementation of solar products to realize a significant penetration in the commercial, residential, and industrial markets. The high cost of fossil fuel based electricity has spurred unprecedented growth in the alternative energy sector. Wind, Geothermal, and Hydro generated electricity have seen a steady decline in their prices. Electricity generated from solar technology has seen a similar drop in its price of electricity due to high manufacturing costs and the manner in which solar panels and products are traditionally used.

Telluric Labs provide intellectual property solutions in the form of software licenses, FPGA/ASIC cores and electronic hardware modules for precision timing synchronization over packet networks. In a \$ 1.4T, fast growing wireless data and telecom industry, precision timing synchronization is a necessary factor for deploying new services and lowering the cost of existing ones. It is the fundamental requirement for the next generation of digital telecommunication networks. The immediate beneficiaries of this technology are the entrenched carriers who have reliable and solid revenues but increasing operating expenses due to exploding bandwidth demands. Sync-Labs aim to be the global leader in providing the fundamental algorithms for clock synchronization over packet networks, which will directly enable low-cost expansion of wireless bandwidth.

Vclin Bio (VIC) is a drug discovery and diagnostics validation solution provider using state-of-art-technologies in translational and nonclinical research for advancing stratified therapeutics, biomarkers research and clinical diagnostics. V ClinBio provides one-stop research services for discovery of small/large molecules (monoclonal antibodies, biologicals, biosimilars) and biomarkers, using genomics, proteomics and metabolomics approaches. V ClinBio's translational research is engaged in functional-phenotypic assays, early-stage, mechanism of action (MoA) and proof-of-concept (PoC) studies supported by cell sorting, multiplex assays, NGS, Sanger sequencing, qPCR, confocal imaging and 2D-DIGE, MALDI-TOF/TOF approaches using clinical samples. V ClinBio collaborates with diagnostic partners to test and validate kits/panels in oncology, psychiatry and other disease areas. V ClinBio also works with clinical teams in the areas of investigative biomarkers and patient stratification strategies. V ClinBio is adept in executing animal toxicology (rodent GLP & non-GLP) and pharmacology studies in multiple disease models.

Wickr Inc. was founded by a team of security and privacy experts that believe private communications is a universal human right that is extremely important to a free society. Today, that right is almost nonexistent.

Our mission is to provide secure communications that Leave No Trace™. Wickr is a mobile messaging platform that is private, encrypted and anonymous. People are being tracked online and their information is being sold in ways they do not understand by numerous governments and corporations throughout the world. Your private communications are worth money. Online communications should be untraceable by default and so Wickr flips messaging on its head, giving control to the sender instead of the receiver (or servers in between). Our patent-pending technology brings sophisticated security and privacy to everybody! Wickr's protocol for ephemeral messaging and media uses military grade encryption and is HIPAA, FIPS 140-2 and NSA Suite B compliant for top secret communication.

x-Dictator/ThermaProx Condition Change Indicator is a safe, non-toxic, environmentally benign temperature-monitoring device that uses the natural laws of physics and chemistry to detect and alert the user of a freeze; a freeze-thaw cycle traversing 0°C. (32° F); or alert one to exposure temperatures greater than 30° C (86° F). The Condition Change Indicator is a small, unobtrusive, inexpensive, non-crushable indicator device that provides an irreversible visual signal. The primary market applications of the Condition Change Indicator on the cold side are anticipated to be the monitoring of vaccines and of frozen food items throughout the "cold chain", from the point of manufacture, throughout shipping to and from various intermediaries; to replacement of a vaccine in a doctor's refrigerator or of a frozen food in a grocer's freezer, and finally from a doctor to a patient or from a frozen food retailer to the consumer's home.
